Dracaena

Dracaena is a genus of forty species of subtropical, evergreen, woody plants grown for their statuesque form and ornamental foliage. Sometimes mistakenly identified as palms they are more closely related to lilies. The name Dracaena is derived from the Greek word "drakaina", a female dragon. The link being the resinous red gum produced when the stem is cut which, when thickened, resembles dragon's blood.

“ Offices that incorporated plants reported a **15%** higher wellbeing score and a **6%** higher productivity score than employees whose offices didn't have plants ”

Source: The 2015 Human Spaces report, which studied 7,600 offices workers in 16 countries

Phalaenopsis

Lux Range
Medium/ High

The orchid family is the largest, most diverse group of plants in the world. Species are found on all continents except Antarctica, they range in habitat from fields to tree-tops, from the temperate climates of Northern Europe to the tropical heat of the Malaysian rainforests. Recent advances in tissue culture techniques has made some popular ornamental species, such as Phalaenopsis and Dendrobium very easy to grow and care for.

Sansevieria

Sansevieria is a genus of plants from Southern Africa that is related to Dracaena and the lily family. Their main feature is the thick, almost succulent, leaves that are often long and strappy. Sansevieria plants have variegated leaves, which range in colour from pale yellow to near black. They are easy to look after and can tolerate quite low light levels, but must never be allowed to get chilled.

Anthurium

Also known as the Flamingo flower, Anthuriums grow wild in the tropical rain forests of Central and South America. The exotic flowers, with their large waxy "palettes" and coloured "tails", have given rise to the word "Anthurium", which is derived from the Greek "anthos", a flower and "oura", a tail. The link with flamingos is rather more tenuous, referring as it does to the "curved neck" and appearance of the spadix.

Exterior/Seasonal

First impressions count. So make a strong, positive statement about your business and make your premises look inviting from the outside. Ambius isn't only limited to designing inspiring interior spaces. We specialise in exterior planting designs too. So whether it's built in beds or window boxes at your front entrance or a large open space, using a range of colourful and seasonal planting, we can help you to welcome colleagues and customers inside.

Buxus

Buxus, commonly known as Box or Boxwood, is a slow-growing evergreen shrub, compact with small, leathery, opposite leaves, and small, yellowish flowers. Native to Europe, Asia, South America, Central America and Africa, Buxus is a genus of approx 70 species and commonly grown for hedges and topiary. Only the European, and some Asian species, are tolerant of frost.
